With the experience gained through years of study and collaboration with vehicle manufacturers, we developed a tool through integration with the sensor allows the ECU to optimize vehicle performance without compromising reliability. One of the strengths of the system is in complete invisibility any diagnosis.

This product is intended for all those who want to give an edge over your vehicle. We would point out that every single piece is rigorously tested before sale under different conditions and extreme use.

Model base POWER BOX:

Toyota Diesel Power Box modules are a category of products whose principle operation is based on the change of control signals and signals sensors outside the engine computer (ECU).

The proposed solutions have been developed so that the effects of their Operation are similar to the effects of Chiptuning. These changes are sometimes the only possible ones - for instance if the unit is not reprogrammable or if the engine is controlled parametrically on the basis of simple logic circuits, and not by a microcontroller.

The modules can be easily installed and removed from the machine in minutes.
